

Assignment 2- Redesign

Analysing the packaging

	capability	Opportunity	motivation
Buy	Structural: the box is sturdy so it minimizes the damage and easier to transport. Visual: has “lower cholesterol” which helps to get the hint for the health benefits but very broad Verbal: “clinically proven” helps users understand why they should buy it	Structural: available in the supermarkets Visual: health focused Verbal: targets strong niche of people who might be concerned about their health	Structural: the plastic tub may not give the sustainable impression Visual: the heart uk approval photo gives a hint that it is clinically proven Verbal: health focus is highly persuasive
Use	Structural: the lid is easy to open Visual: no clear on pack guidance for portion suggestion. Verbal: limited guidance on how much to use for starting to see an effect	Structural: no portioning system Visual and verbal: lack of instructions connecting health outcomes	Structural: the easy resealing for the reuse Visual: consistent reminders of health benefits Verbal: health cues to remind the user for the continuous consumption
discard	Visual: no clear recycling icon Verbal: no clear explanation that the lid/ tub should be separated	Verbal: no messages encouraging the reuse of the product	Verbal: lack of sustainability cues

COM-B analysis for the butter packaging

COM-B component	What needs to happen for the behaviour to occur?	Need for a change?
Physical capability	Being able to open the lid easily	No need for change
Psychological capability	Understand how much to consume for health benefits and how to dispose of packaging correctly	Need for change
Physical opportunity	Packaging design supports separating the materials before disposing	Need for change
Social opportunity	Deep dive into how the sterol lowers cholesterol naturally	Need for change
Reflective motivation	Believe that the product would improve health	No need for change
Automatic motivation	Develop habits of separating the fat residues from the packaging before disposal	Need for change

Product improvement explanation

66% of the audience chooses the more sustainable packaging (redesign).

The sterole dosage in the old design was only verbal and inspecific. To elevate it, it was chosen to be structural by setting the average daily dosage. This has reduced the misunderstanding of the claim and made it more specific.

Greenwashing elements were eliminated and instead a sterol chemical structure was put to enhance the clarity of the product ingredients.

The redesign

The change between the original packaging and the redesign worked to a great extent because where to dispose was clearer using the icons, and the redesign also tackled the "motivation problem" according to the COMbi analysis that was executed. This was done by making a lottery and explanation was implemented through a QR code. Therefore, it could communicate better where and how it can be disposed.

A total of 12 participants evaluated the redesigned packaging using a 5-point scale in comparison to the original packaging. The envisioned behaviour was that users would:

1-perceive the package as attractive (or standing out)

2-easily understand its ingredients information

3-clearly know how to dispose of it

The redesign questions covered 5 aspects with their hypothesis

H₁→Visual appeal	The packaging is redesigned with improved clearer visual communication with icons and sustainable (structural, visual and verbal) cues than the old packaging, users will perceive the package as visually appealing (average score ≥ 4).
H₂→Motivation to dispose	If the redesign improves the costumer behaviour towards the motivation to separate the materials of the packaging and dispose it .(average score ≥ 3.5). This is with keeping the colour palette and the theme of the product the same
H₃→Disposal clarity	If the packaging integrates disposal instructions clearly users will clearly understand how to dispose of the packaging (average score would be ≥ 4). It is also expected to find alot of discrete difference between the numbers during testing because some people come from different environment that explains the way a package should be disposed differently.
H₄→Instruction transparency	If disposal instructions are communicated through icons and text, users will perceive the instructions as clear and understandable (average score would be ≥ 4).
H₅→Ingrediant transparency	The ingredient information is communicated transparently, users will perceive the packaging as transparent about its contents (average score after testing ≥ 4).

Observation and comparison testing method

The survey had comparison questions between the 2 products (the original and the redesign).

For the observation part, it was about noticing people's behaviour towards the redesign, beyond their words, for instance, their reactions and their facial expressions during filling in the surveys

Data analysis

and the test plan

- 1 Poor
- 2 Fair
- 3 Average
- 4 Good
- 5 Excellent

Question (criteria)	Average score	Percentage of total people score
To what extent does the package visually appealing	4.7	94%
The package motivates the consumer to separate the material before disposing	4.6	92%
Its is obvious how to dispose the package	3.6	72%
The packaging has clear instructions on how to dispose	3.3	66%
The packaging has transparent informations about its ingredients	4.5	90%

Redesign

Original

Findings and results from the survey

Visual appeal (4.7 / 94%)

The packaging is perceived as highly appealing. This indicates that the design aesthetics, the used softer colours, and layout successfully attracted people's attention.

Motivation to dispose (4.6 / 92%)

The packaging significantly showed the motivational behaviour to dispose the package when separating the layers and scrabbing the residuals.

Disposal clarity (3.6 / 72%)

The consumers somewhat understand how to dispose of the packaging, but the clarity is not optimal since it was not the main focus for the packaging.

Disposal instructions (3.3 / 66%)

Instructions are perceived as only partially clear, suggesting that icons for the demonstration part would need improvement because a big part did not understand what the icons were trying to communicate

Ingredient transparency (4.5 / 90%)

Users perceive ingredient information as transparent and accessible due to explaining the sterol ingredient and using its leaf and the chemical structure for transparency

Reflection on the Hypothesis

H₁ → Accepted.

Average of 4.7 indicates that the packaging redesign successfully improves visual attractiveness. Participants found the design engaging and appealing.

H₂ → Accepted

4.6 suggests that the packaging redesign successfully improved the motivation for the participants to separate the materials

H₃ → Not accepted.

3.6 means that users understand disposal methods but still experience uncertainty. According to the feedback, it was due to the unclear recycling symbols

H₄ → Not accepted.

3.3 means that disposal instructions are insufficiently clear. It does not have a PMD icon

H₅ → Accepted.

The high score 4.5 confirms that the packaging successfully communicates ingredient information clearly

Evaluation of behavioural change

The envisioned behaviour was for users to recognize the product, understand its sustainability according to the cues, and dispose of it correctly.

The design partially achieves the intended behavioural outcome in terms of disposing the package into the PMD disposal bin, most of them will just throw it according to their knowledge but there is no clear instruction that says where it should be thrown.

The design however did achieve the behavioural outcome from the aspect of separating the material inside the butter box, scrapping the residual to win the lottery, which reflects the solution for the main problem

Perceived Sustainability Change

The redesigned packaging appears to improve the perceived sustainability score of the product, particularly through the transparent and straight forward ingredient communication (4.5) and the motivation to dispose (4.6). However, sustainability communication could be further strengthened by making recycling instructions clearer and more visible by using different icons than the used ones.

Design improvements for Future Packaging

1. Improve disposal communication

Sustainability instructions for disposing should be simplified and visually dominant, this can happen by balancing where to dispose the packaging and the motivation to throw it (the lottery). The visual cues should be enhanced by using icons that are more universally known so a wide variety of people could understand what the instruction is trying to communicate through that icon.

2. Keep ingredient transparency

The sterol ingredient transparency was highly appreciated by users and should remain a key design strength.

Feedback

Received feedback (observation)

The general feedback that was received that the disposal place could be improved because the redesign draft did not directly state where it should be disposed. It was because during designing the main focus was to design something that would motivate the consumers to separate the material and dispose it but it was not clear where to dispose it.

The use of AI

AI was used in:

- Converting the packaging map into the packaging of the redesign

Prompt:

Use the the packaging map to create a box of this redesigned packaging.

- Putting the average score and asking AI to calculate the percentages for each hypothesis

Prompt:

Visual appeal-4.7, motivation to dispose-4.6, disposal clarity-3.6, disposal instructions 3.3, ingredients transparency-4.5. The total number of survey was 12 reponses. Calculate each percentage of the total score for the maximum score
