The blister gets 100% landfilled

EOL - Waste Streams BLNC Blister

Our sleeve and blister

Design Properties

Current blister = 7,0 grams

PET blister = 2,49 grams

Current sleeve = 10,5 grams

1 PET sleeve = 11,5 grams

Cardboard sleeve = 5,85 grams

Total weights

Current blister + current sleeve = 17,50 grams

PET blister + PET sleeve = 13,99 grams

PET blister + cardboard sleeve = 8,34 grams

The Packaging required to deliver one consumer unit of compressed mint gums (e.g. 12 pieces) to the consumer, ensuring protection of the product and maintaining its quality and functionality through y distribution, storage and use

Sleeve Design Justification

Sleeve

- Incentivizing
- Education
- Disposal

Bin System Motivation

1. From Waste to Value
2. Every Pack Has a Journey
3. Rewarding Responsibility
4. Lead the Change, Do Not Chase It

- Benefits for Sportlife & Cloetta
- Benefits for Albert Heijn
- Collaboration for Collection Bins
- Return on the Go
- Sequential Reuse
- Consumer Convenience
- Motivating Customers

COM-B analysis

10

COM-B Component

Psychological Capability

What needs to happen
for the behavior to
occur?

They move automatically
to selecting the more
sustainable packaging

Possible
need for
change

Social Opportunity

Can be bought anytime
from the supermarkets

No need
for
change

Automatic Motivation

Develop habits of buying
the monomaterial
packaging and disposing
it in the right bin

Need for
change

Testing Method - Comparison: Survey of Five Questions

Questions Asked in the Survey (Criteria)

Average Score

To what extent does the package visually appealing?

4.4

The package motivates the consumer to buy it and prefer it over the original packaging

4.2

The packaging has clear information on the monomaterial

4.3

It is easy and convenient to use

4.0

Trade-offs

12

- **Sustainability vs. Convenience**

LCA vs. CMB

- **Recycle-ability vs. Functionality**

EoL vs. Packaging

- **Cost vs. Sustainable Business Perspective**

LCA vs. Packaging

- **Standardisation vs. Brand Differentiation**

EoL vs. CMB

Phase/COM

Capability

Opportunity

Motivation

Buy

- Clear labeling
- Familiar product
- Easy decision
- Affordable

- Widely available in Dutch supermarkets
- Small, visible packaging encourages impuls buying

- Desire for fresh breath
- Habitual purchase
- Low emotional engagement

Use

- Very intuitive (open, chew)
- No instructions needed
- Suitable for all users

- Can be used anywhere, anytime
- Portable and resealable packaging

- Strong initial freshness sensation
- Sensory pleasure (mint, cooling)
- Motivation drops as flavor fades

Discard

- Basic understanding to throw away gum
- Unclear disposable guidance

- Limited access to bins in some contexts
- No built-in disposal feature
- Packaging separation unclear

- Very low motivation to dispose properly
- No reward/incentive
- Leads to littering or sticking gum

Packaging and Packaging Waste Regulation (EU) 2025/40 (PPWR)

Blister gum packaging of the redesign is classified as PET contact-sensitive packaging. This means that by 2030, it must be made of at least 30% recyclable material. By 2040, this increases to a minimum of 50%.

Packaging can only qualify as "reusable" under strict criteria; it must have and survive multiple use cycles and there must be systems for reuse in place, not a possibility to.

By 2030, all packaging must be designed for recycling. By 2035, all packaging must be recyclable at scale. By 2038, all packaging must meet high recyclability grades (A/B).

We intend to use a minimum of 50% rPET film. However, flexible films with 30-50% food-grade rPET are not widely available. If demand cannot be met, a PET film with a lower amount of recycled material than deemed necessary by the PPWR could be used. As we are working with food packaging, using 30-50% rPET film is only a legal requirement if it can be safely done. If the amount of EFSA-compliant food-grade rPET is less than needed or the used recycling processes do not exist, an exemption can be made. For this, it is necessary to prove that PET film is the only suitable material for the product, or that using another material will deteriorate either the product or its recyclability or sustainability targets.

The (r)PET sleeve can survive multiple reuse cycles and will be cleaned and restored in between them. The system for reuse is fully worked out. After the blister has run out, the consumer will have to carry the empty sleeve with them until they go to the store again, as a return on-the-go system is used. With this, we aim for a sequential reuse system, where the company is responsible for cleaning and restoring the secondary packaging. For ease of access, a collaboration with Albert Heijn is used, where return bins will be places in the store, next to the exit. This way, consumers do not need to alter their lifestyles to properly dispose of the product. This reuse system will be tested on a smaller scale beforehand.

Mono-material PET film is suitable and is recyclable at scale. It meets the needed high recyclability grade.

Packaging and Packaging Waste Regulation (EU) 2025/40 (PPWR)

Use of multi-layer composites and non-separable materials should be avoided in packaging.

PPWR + Single-Use Plastics EU Directive 2019/904

PPWR + Waste Framework Directive 2008/98/EC

Packaging must minimize weight and volume and avoid unnecessary layers.

Mono-material PET films are suitable. Sleeve design changes from glue to a notch also matches this. The PET sleeve further fulfills this goal by making the entire product mono-material, aside from the ink.

Reduction of unnecessary single-use plastic, ban or restriction of small-format packaging. Individually wrapped gum can be seen as excessive single-use packaging, thus a justification is required.

There will be fees introduced based on the recyclability and environmental impact of a product-packaging combination.

PET films are lightweight and thin. The sleeve adds weight and volume, but is necessary to supply information. This cannot be done directly onto the blister, since it would reduce recyclability.

As the shelf life of gum deteriorates depending on O₂ and moisture uptake, the gum must be either individually wrapped or have a proper seal within a reusable packaging system. Adding a sealant to the packaging would go against our mono-material vision and minimize recyclability, making individual wrapping a necessity.

Blister and sleeve redesign are highly recyclable. Overall impact lies within the concept of blister gum packaging; that is inherently wasteful. No-to-low fees are expected.
